# Content & Responsive Design

Responsive design is an approach that aims to provide an optimal user experience across all devices.

- Mobile first strategy
- Flush out page structure as device width increases
- Layout and design fit across all devices

Responsive design does not always mean Responsive Content.

- Responsive design does not always consider context of use.
- Focus often put on theme appearance versus content distribution.

## Defining Your Content

## Static Content

- Branding data
- Main menu
- User menus
- Footer links
- Copyright

## Dynamic content

- Main content
- Sidebars
- Specialty menus
- User specific

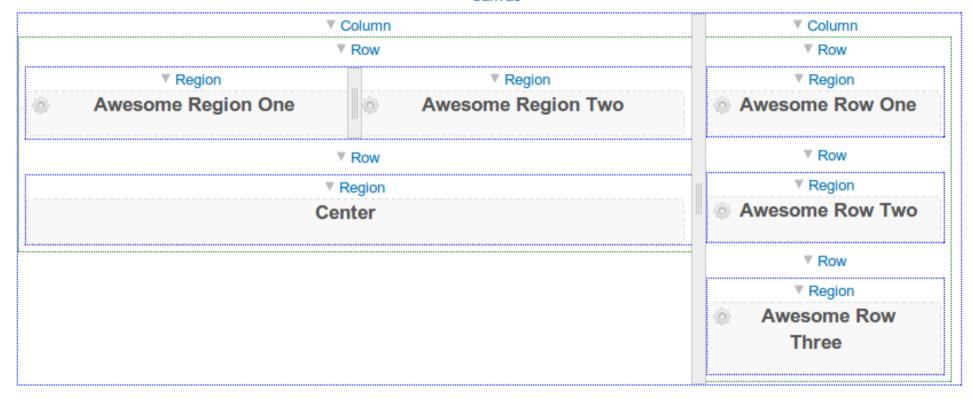

# Harnessing Panels

- Use panels for dynamic content
- Utilize custom panel layouts for unique experiences
- Greater control of content and its placement

## The Layout Builder

#### ▼ Canvas

- WYSIWYG Editor -
- Easily build layouts on the fly -
- Shows the full power of layouts -

# Making Content Awesome

## **AWESOME EXAMPLE**

The Empire Strikes Back

In my experience, there is no such thing as luck. What!? You don't believe in the Force, do you? You don't believe in the Force, do you?

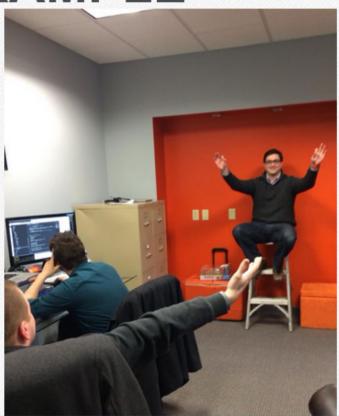

The Battle for Endor

The Force is strong with this one. I have you now. You mean it controls your actions? I'm surprised you had the courage to take the responsibility yourself. The Force is strong with this one. I have you now.

Your eyes can deceive you. Don't trust them. Don't underestimate the Force.

What good is a reward if you ain't around to use it? Besides, attacking that battle station ain't my idea of courage. It's more like...suicide.

Look, I can take you as far as Anchorhead. You can get a transport there to Mos Eisley or wherever you're going. I have traced the Rebel spies to her. Now she is my only link to finding their secret base.

SEARCH

Powered by Drupal

#### DEFAULT SHORTCUTS

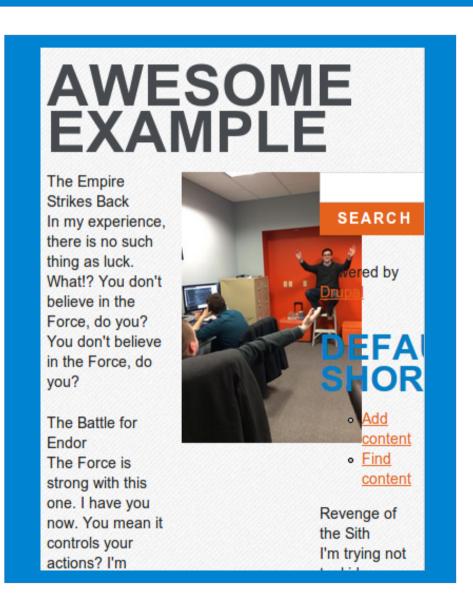

- Add content
- · Find content

Revenge of the Sith

I'm trying not to, kid. Hokey religions and ancient weapons are no match for a good blaster at your side, kid. What good is a reward if you ain't around to use it? Besides, attacking that battle station ain't my idea of courage. It's more like... suicide. All right. Well, take care of yourself, Han. I guess that's what you're best at, ain't it?

## But not for all devices

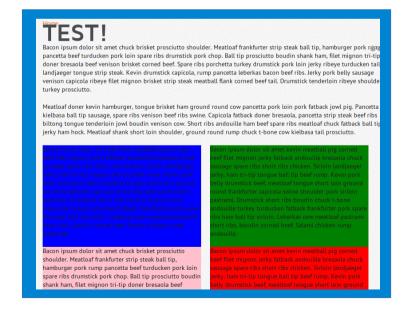

- Layout builder isn't responsive
- Uses hard set percentage points
- Control to build layout, but not control of responsive display.

# Solution: Custom Panel Layouts

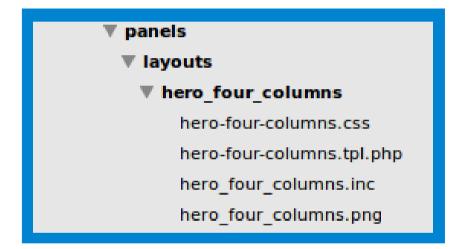

- Full control of layout structure.
- Ability to define column widths
- Implementation of breakpoints
- Control of how the content reacts per breakpoints.

# Creating a Panels Layout

- Created in theme or module
- Uses four files
  - CSS file
  - · Template file
  - · Include file
  - · Icon file
- Initiated through CTools plugin API
- Include file contains the plugin array, and any template functions.
- template\_preprocess\_name()
   allows for template manipulation.

Note: Review the layouts folder within the Panels module for examples

## Layout Configuration Example

```
// Plugin definition
$plugin = array(
  'title' => t('Hero, 4 columns'),
  'icon' => 'hero four columns.png',
  'category' => 'Responsive Layouts',
  'theme' => 'hero_four_columns',
  'css' => 'hero-four-columns.css',
  'regions' => array(
    'hero' => t('Hero'),
    'column_one' => t('Column 1'),
    'column_two' => t('Column 2'),
    'column_three' => t('Column 3'),
    'column_four' => t('Column 4'),
```

#### What's going on here?

- Defines the title
- Icon location
- Category
- The theme used
- CSS file name
- Array of regions

#### **Drupal.org** Documentation

https://drupal.org/node/495654

## hook\_template\_preprocess().

Utilize template hook to add CSS classes to regions

Provides means of handling missing dynamic content

```
// Sets the Panel layout classes.
$variables['attributes_array']['class'][] = 'panel-display';
$variables['attributes_array']['class'][] = 'panel-display-hero-four-column';

foreach($variables['content'] as $name => $item) {
    $variables['region_attributes_array'][$name]['class'][] = 'panel-region';
    $variables...['class'][] = 'panel-region--'.drupal_clean_css_identifier($name);
}
```

## Layout Template Example

```
<div<?php print $attributes ?>>
  <div<?php print drupal_attributes($wrapper_attributes_array)?>>
  <?php foreach(array intersect key($content, $layout['regions']) as $name =>
$item): ?>
    <?php if (!empty($item)): ?>
      <div<?php print drupal_attributes($region_attributes_array[$name])?>>
        <?php print $item ?>
      </div>
    <?php endif; ?>
  <?php endforeach; ?>
</div>
```

## Letting Panels Know About the Layout

#### Themes - .info file

```
; Plugins
plugins[panels][layouts] = panels/layouts
```

#### Modules - .module file

```
/**
 * Implementation of hook_ctools_plugin_directory()
 */
function mymodule_ctools_plugin_directory($module, $plugin) {
 if ($owner == 'panels') {
    return "panels/$plugin";
 }
}
```

# Responsive and Sass-y

·Singularity is a flexible, and simple, grid framework for handling responsive structure.

- ·Breakpoint for controlling your making breakpoints simple.
- \*Compass to bring it all together. Plan ahead for config.rb management.

# Singularity & Breakpoint

- Singularity grids are defined simply as variables.
- Allows you to define number of grids at different min-width
- Breakpoint allows you to target your media queries
- Inside breakpoints items can be assigned grid widths.

```
// Singularity grid configuration
$grids: 4;
$grids: add-grid(12 at $tab);
$gutters: 1/3;
// Breakpoint & grid implementation
@include breakpoint($tab, true) {
  .panel-display {
   .panels-regions__two {
      @include layout(4) {
        .panels-region {
          @include float-span(2);
```
